APPENDIX B SCA APPLICATION ENVIRONMENT PROFILE

B.1 SCOPE

This appendix defines the Application Environment Profile (AEP) for the SCA, based on Standardized Application Environment Profile - POSIX® Realtime Application Support (AEP), IEEE Std 1003.13-2003.

The application environment profile (AEP), is the SCA required profile referenced in sections 3.1.1, 3.2.1, and 3.3.1 of the main document. The SCA dictates that an Operating Environment provides the options and functions designated as mandatory within this AEP and constrains an application to only use those services.

B.2 CONVENTIONS

Within this appendix, the following abbreviations are used:

1. “MAN” indicates that the identified function or option is mandatory for the indicated profile
2. “NRQ” indicates that the identified function or option is not required for the indicated profile
3. “PRT” indicates that only a subset of the indicated option or unit of functionality is required. This designation will be followed by a note or cross-reference indicating which elements are required.

B.3 STANDARDS

The standards identified in Table B-1 are required in whole or in part by the SCA AEP application environment profile.

Table B-1: Required Standards

Standard	SCA AEP
C Standard (ISO/IEC 9899:1999)	PRT ¹
POSIX (ISO/IEC 9945:2003)	PRT

B.4 CONSTRAINTS

The real-time profile defined in this appendix requires only specific Units of Functionality of the included standards. The absence of particular elements of these standards introduces constraints on the use of some of the features of particular functions. These constraints must be observed by an application that conforms to the profile when using each of the required functions.

[®] POSIX is a registered trademark of the Institute of Electrical and Electronics Engineers, Inc.

¹ Specific functions and options are identified in section B.4

An Ada AEP has not been explicitly defined. Any Ada application shall be restricted to using the equivalent Ada functionality, as defined in POSIX Ada language binding (ISO/IEC 14519:2001), designated as mandatory by the AEP or may use the C interface.

B.4.1 POSIX.1

The options, limits, and any other constraints on POSIX.1 shall be provided as described in Table B-2.

{_POSIX_TRACE_EVENT_FILTER}	NRQ
{_POSIX_TRACE_LOG}	NRQ

NOTES:

- PRI - The primary file system shall generate an error for pathname components longer than NAME_MAX. The user is responsible for semantics of other file systems that may be mounted.
- Embedded processor C/C++ run-time libraries typically do not support stdio.h or iostream.h.
- Heavy weight processes are typically not supported in embedded operating systems. The mandatory POSIX.1b options can be implemented without the use of heavy weight signaling.

B.4.1.1 Single Process Function Behavior

The functions in Table B-3 shall behave as described in the applicable clauses of the referenced POSIX referenced POSIX specifications contained in Table B-1.

B.4.1.4 Signals Function Behavior

Operating systems on embedded processors typically support neither signaling nor exception handling. POSIX does not define behaviors associated with divide by zero or overflow /

underflow. Signaling methods introduced as part of POSIX.1c are more consistent with the multi-threaded, single process model of a resource constrained processing environment.

The functions listed in Table B-6 shall behave as described in the applicable clauses of the referenced POSIX specifications contained in Table B-1, except for the following constraints:

1. An application that conforms to the AEP shall not result in abnormal termination of the process because this profile does not support multiple processes.
2. An application that conforms to the AEP shall not call the kill() function with a negative argument because this profile does not require process group functionality.
